

Yield Building Tips for Humates

HUMATES

- Supply a carbon source with all nitrogen sources to avoid humus depletion. Humates are the best option here, as they have the highest organic carbon levels of any material.
- Combine fulvic acid (**NTS Fulvic Acid Liquid™**) with all foliar fertilisers, as it will magnify their effect.
- Include **NTS Soluble Humate Granules™** with all granulated phosphate fertilisers. The humic acid will complex the phosphate to form a stable phosphate humate. This may be the first time you'll experience full-season phosphate availability.
- Urea and humic acid are perfect partners. Trial a urea-treated area with and without the humic acid additive – you may soon become a convert.
- Most conventional farm soils are seriously lacking fungi, which play an important role in fertility and disease prevention. Regular applications of humic acid (**NTS Liquid Humus™**) will feed your existing fungi and help to overcome the fungi/bacteria imbalance.
